Successfully combine research knowledge and entrepreneurial thinking.

The combination of research knowledge and entrepreneurial thinking spurs medical progress. If the translation of findings from basic research into the world of business succeeds, ideas turn into marketable products, therapies and applications. Conversely, research can be inspired by practical needs in the life sciences.

With the launch of the specialized Minor in BioMed Entrepreneurship, scientists at the University of Zurich have, for the first time, the opportunity to learn about the tools for successful knowledge translation and to develop their entrepreneurial skills.

Requirements for admission

Admission is open to students of natural sciences or medicine, with a substantial amount of theoretical and practical training in life sciences, namely

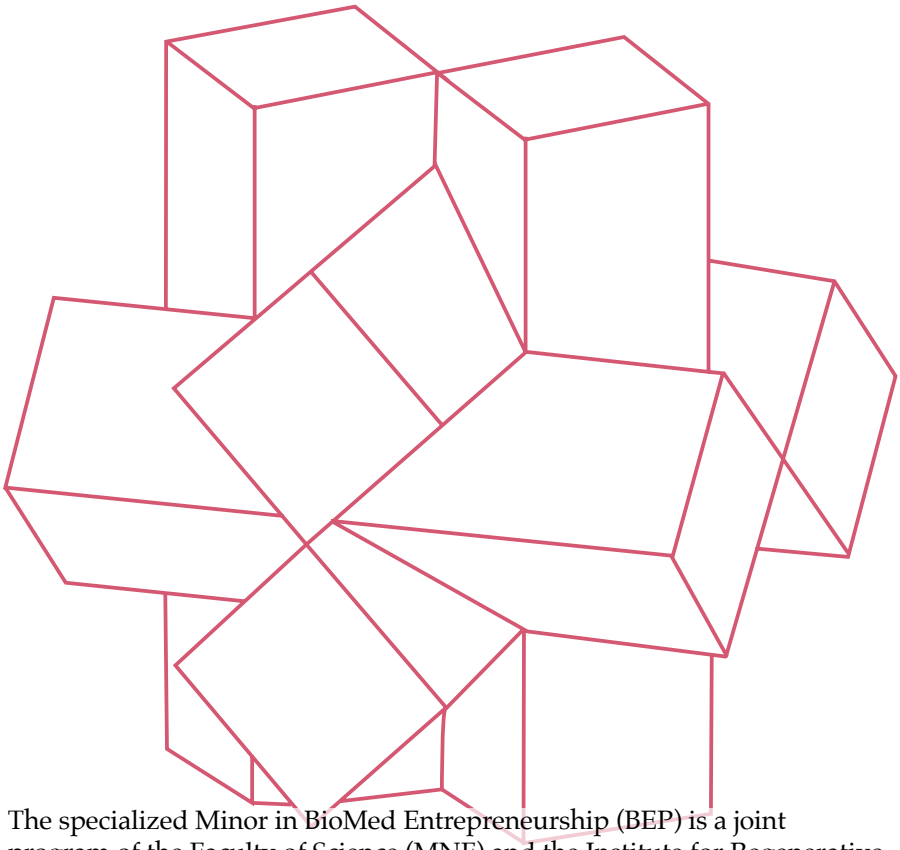
- Biology
- Biochemistry / Biomedicine
- Chemistry / Business chemistry
- Medicine
- Pharmacy
- Physics

Ideally, students will be about to complete their Master's degree and already have a sound scientific education. This Minor requires applications to be made via an application form.

Qualification goals

Graduates of a Minor in BioMed Entrepreneurship are able to:

- recognize and formulize company-relevant questions for the translation of scientific knowledge;
- acquire in-depth specialist knowledge through independent work;
- apply methods of interdisciplinary collaboration and understand the value of interdisciplinarity;
- analyze theories and case studies to critically evaluate their results and incorporate them into concrete projects;
- understand the various dimensions of an entrepreneurial implementation and their significance in specialist and operational contexts;
- communicate knowledge and complex interrelationships in a way that is appropriate for a range of different stakeholders.



The specialized Minor in BioMed Entrepreneurship (BEP) is a joint program of the Faculty of Science (MNF) and the Institute for Regenerative Medicine · IREM, Faculty of Medicine (MeF).
